DATA PROCESSING GUIDE - SIMPLE PENDULUM LAB

The raw data is in the Excel file (sheet Data).

Processing steps:
1. Calculate the period of one swing: T = t / 10, where t = time for 10 swings.
2. Calculate the gravitational acceleration: g = 4 x pi^2 x L / T^2, where L = string length.
3. Round T and g to 3 decimal places.

Table 1 - Calculation Results, with columns in this order:
| Trial | L (m) | T (s) | g (m/s2) |

Table 2 - Summary, containing:
- mean g (rounded to 3 decimals)
- percent error against the literature g of 9.8 m/s2:
  error = |mean g - 9.8| / 9.8 x 100 (rounded to 2 decimals)
